

Client Type: Financial Systems

The Challenge: A large investment firm was looking to create an intranet (internal network) that could be used by their traders, researchers and other groups within the organization to provide various reports for internal and external use. The proposed intranet needed the capability to search a library of all published documents. Furthermore, the client's employees needed to be able to use the solution on their PDAs (Blackberry, iPhone, etc).

The Solution Provided: InfoTech engaged the client in a survey and analysis (S&A) to gather all of the specifications for the system and to develop a blueprint of the features requested. This blueprint enabled InfoTech to subsequently provide the client with an exact timeframe and cost for the actual software development of the system.

Current Status: The system has been successfully developed and delivered to the client. InfoTech currently provides both ongoing maintenance and development of new features as requested.

Technical Solutions Implemented:

1. Microsoft Sharepoint
2. .NET
3. Microsoft SQL Server
